

Bumble Pet

Galvanize Q3 Project
Steven Fiero

Bumble Pet

- It's kinda like Tinder
- It's not like eHarmony
- Bumble is new, so its more like Bumble.
- Except it's not a dating app.
- It's for animal shelter pets who need adoption.

How it got started

Build Tools

- **Front End:** EJS, Google Materialize
- **API to get Pet data:** Petfinder API
- **Routes:** Express.js,
- **SQL queries:** Knex.js
- **Back End Database:** PostgreSQL
- **Middleware:** Express-session, bcrypt, Morgan, body-parser

Functionality

- User can sign in / sign up
- User can search by type of pet
- User can search by location (city, state or zip)
- Pet info is displayed along with shelter contact info

Challenges

- Manipulating data from object returned from API into format needed.
- API had many nested variables, i.e. objects within arrays within another object.
- Dynamically adding content to DOM to view on page.

Future Functionality

- Swipe left to see next pet
- Swipe right to see details of pet & save to favorites
- Favorite pets list
- Option to use current geolocation instead of city/state/zip search
- Added search functionality, i.e. breeds, size, age

“The best things in life are rescued.”
